Water samples were collected by vessel outside the influence of any artificial turbidity plume for background sampling and at the edge of the mixing zone for compliance sampling. Sampling locations varied with tidal conditions and were selected based on flow direction relative to the dredge site. A standard water sampler was used to collect the water column sample by lowering the open chamber to the target depth, closing it to capture the sample, and retrieving it carefully to avoid agitation. Samples were immediately transferred into clean, matched turbidity cuvettes handled in accordance with FT-1600 requirements, ensuring no fingerprints, bubbles, or contamination.

All turbidity measurements were performed using a turbidimeter that meets FT-1600 requirements. Each morning before sampling, the meter was calibrated using manufacturer-certified StablCal standards at 20, 100, and 800 NTU, followed by a 10 NTU low-level verification standard. The verification reading was required to fall within the FT-1600 acceptance limit of ±8%, and the percent difference was calculated each morning to confirm compliance. All calibration standards were verified to be within expiration and used in accordance with FT-1600 procedures. After analysis, cuvettes were rinsed with turbidity-free water and stored for future use. GPS coordinates for each sample location were recorded using a satellite-based device to document the precise time, location, and sample type for full traceability.
